ABSTRACT:

PROBLEM TO BE SOLVED: To reduce the memory capacity necessary for holding the information by sharing the information content to be held and managed in the system of an OSI management agent in regard to the holding form of the information and an overlapping part of the system.

SOLUTION: The event occurring at a management object (1-a) is reported to a Log (1-b) and an EFD (1-c) respectively as the internal processing of an OSI management agent. The contents of the **LOG** (1-b) are **logged in a Log** Record (1-d),

and in the same way the EFD (1-c) performs a **filter** test to **Notification** and informs a manager of this test contents. The event information to be notified to the manager is shared with the attribute (1-g) of the object (1-a) itself where the event occurred. Thus, the memory capacity necessary for holding the information can be reduced.
